Bird recognition in the city of Peacetopia (case study)

100%

1. Problem Statement

1 / 1 point

This example is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic: they are afraid of birds. To save them, you have to build an algorithm that will detect any bird flying over Peacetopia and alert the population

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

There are a lot of decisions to make:

- · What is the evaluation metric?
- How do you structure your data into train/dev/test sets?

Metric of success

The City Council tells you that they want an algorithm that

- 2. Runs quickly and takes only a short time to classify a new image.
- 3. Can fit in a small amount of memory, so that it can run in a small processor that the city will attach to many different security cameras.

 $\underline{\text{Note}}\text{: Having three evaluation metrics makes it harder for you to quickly choose between two different algorithms, and the property of the property o$ will slow down the speed with which your team can iterate. True/False?

O False

✓ Correct

2. After further discussions, the city narrows down its criteria to:

- "We need an algorithm that can let us know a bird is flying over Peacetopia as accurately as possible."
- "We want the trained model to take no more than 10sec to classify a new image."
- "We want the model to fit in 10MB of memory."

If you had the three following models, which one would you choose?

)	Test Accuracy	Runtime	Memory si	re
	97%	1 sec	3MB	
)	Test Accuracy	Runtime	Memory si	e
	99%	13 sec	9MB	
C	Test Accuracy	Runtime	Memory si	re
	97%	3 sec	2MB	
	T+ 4	Donathana	Manageral

These images are different from the distribution of at you think it could help your algorithm. Ing set will make the distribution of the training set different from the

have the same distribution.

False is correct: Sometimes we'll need to train the model on the data that is available, and its distribution may not be the same as the data that will occur in production. Also, adding training data that differs from the dev set may still help the model improve performance on the dev set. What matters is that the dev and test set

✓ Correct

A bigger test set will slow down the speed of iterating because of the computational expense of evaluating models on the test set.							
The test set no longer reflects the distribution of data (security	cameras) you most care about.						
✓ Correct							
This would cause the dev and test set distributions to become different. This is a bad idea because you're not aiming where you want to hit.							
✓ Correct							
☐ The 1,000,000 citizens' data images do not have a consistent x-New York City/Detroit housing prices example from lecture).	->y mapping as the rest of the data (similar to the						
. You train a system, and its errors are as follows (error = 100%-Accur	racy):	l point					
Training set error	4.0%						
Dev set error	4.5%						
Yes, because having 4.0% training error shows you have high be Yes, because this shows your bias is higher than your variance. No, because this shows your variance is higher than your bias. No, because there is insufficient information to tell.							
✓ Correct							
. You ask a few people to label the dataset so as to find out what is h of accuracy:		l point					
Bird watching expert #1	0.3% error						
Bird watching expert #2 Normal person #1 (not a bird watching expert)	0.5% error 1.0% error						
Normal person #2 (not a bird watching expert)	1.2% error						
If your goal is to have "human-level performance" be a proxy (or est level performance"?	timate) for Bayes error, how would you define "human-						
0.0% (because it is impossible to do better than this)							
0.3% (accuracy of expert #1)							
O.4% (average of 0.3 and 0.5)							
0.75% (average of all four numbers above)							
✓ Correct							
Which of the following statements do you agree with?		l poin					
A learning algorithm's performance can be better than human-level performance but it can never be better than Bayes error.							
A learning algorithm's performance can never be better than human-level performance but it can be better than Bayes error.							
A learning algorithm's performance can never be better than human-level performance nor better than Bayes error.							
A learning algorithm's performance can be better than human-level performance and better than Bayes error.							
✓ Correct							
Nou find that a team of a milk also into July 1997	page gets an even better 0.40/f						
 You find that a team of ornithologists debating and discussing an in define that as "human-level performance." After working further on 		l poin					
Human-level performance							
Training set error	0.1%						

Based on the evidence you have, which two of the following four options seem the most promising to try? (Check two options.)

2.1%

Dev set error

Try decreasing regularization.						
✓ Correct						
Get a bigger training set to reduce variance.						
Train a bigger model to try to do better						
✓ Correct						
Try increasing regularization.						
 You also evaluate your model on the test se 	t, and find the following:	1/1 point				
Human-level performance	0.1%					
Training set error	2.0%					
Dev set error	2.1%					
Test set error	7.0%					
rest set error	7.070					
What does this mean? (Check the two best of	ptions.)					
You have overfit to the dev set.						
✓ Correct						
You have underfit to the dev set.						
You should get a bigger test set.						
7 V 1 10 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1						
You should try to get a bigger dev set.						
✓ Correct						
2. After working on this project for a year, you Human-level performance Training set error	0.10% 0.05%	1/1 point				
Dev set error	0.05%					
What can you conclude? (Check all that appl	y.)					
human-level performance.	the result of statistical noise) since it should not be possible to surpass sias, thus progress will be slower going forward.					
✓ Correct						
If the test set is big enough for the 0.05	% error estimate to be accurate, this implies Bayes error is ≤ 0.05					
✓ Correct						
With only 0.09% further progress to ma	ke, you should quickly be able to close the remaining gap to 0%					
both deliver systems with about the same ru However, when Peacetopia tries out your ar	r competitors to build a system as well. Your system and your competitor unning time and memory size. However, your system has higher accuracy! ad your competitor's systems, they conclude they actually like your lough you have higher overall accuracy, you have more false negatives (failing what should you do?	1/1 point				
C Look at all the models you've developed negative error rate.	d during the development process and find the one with the lowest false					
Ask your team to take into account both	n accuracy and false negative rate during development.					
Rethink the appropriate metric for this	task, and ask your team to tune to the new metric.					
	ric, and use this new metric to drive all further development.					
✓ Correct						

14. You've handily beaten your competitor, and your system is now deployed in Peacetopia and is protecting the citizens from 1/1 point $birds!\ But\ over\ the\ last\ few\ months,\ a\ new\ species\ of\ bird\ has\ been\ slowly\ migrating\ into\ the\ area,\ so\ the\ performance\ of\ months$ your system slowly degrades because your data is being tested on a new type of data.

You have only 1,000 images of the new species of bird. The city expects a better system from you within the next 3 months. Which of these should you do first?

\odot	Use the data you have to define a new evaluation metric (using a new dev/test set) taking into account the new
	species, and use that to drive further progress for your team.

- O Put the 1,000 images into the training set so as to try to do better on these birds.
- O Try data augmentation/data synthesis to get more images of the new type of bird.
- Add the 1,000 images into your dataset and reshuffle into a new train/dev/test split.

15. The City Council thinks that having more Cats in the city would help scare off birds. They are so happy with your work on 1/1 point the Bird detector that they also hire you to build a Cat detector. (Wow Cat detectors are just incredibly useful aren't they.) Because of years of working on Cat detectors, you have such a huge dataset of 100,000,000 cat images that training on this data takes about two weeks. Which of the statements do you agree with? (Check all that agree.)

☑ If 100,000,000 examples is enough to build a good enough Cat detector, you might be better of training with just 10,000,000 examples to gain a \approx 10x improvement in how quickly you can run experiments, even if each model performs a bit worse because it's trained on less data.

✓ Correct

- Having built a good Bird detector, you should be able to take the same model and hyperparameters and just apply it to the Cat dataset, so there is no need to iterate.
- Needing two weeks to train will limit the speed at which you can iterate.

✓ Correct

Buying faster computers could speed up your teams' iteration speed and thus your team's productivity.

✓ Correct
